Operating the 3-Point Lock System

Congratulations on your purchase of a MASTERCRAFT® 3-Point Lock System! You have taken a great step toward a more secure home. Here are some operational tips.

Your 3-point locking mechanism contains a door latch and three deadbolt mechanisms.

**Engaging the Deadbolts**

To engage the deadbolts:

1.) The anti-slam mechanism must be depressed. This will happen automatically when the door is closed or can be depressed manually (fig. 1).

2.) The handleset must then be rotated upwards to engage the latches (fig. 2).

Note: The door is not locked at this time.

**Locking the Door**

The door may be locked two ways:

1.) From the interior of the home, once the deadbolts are engaged the thumb latch may be turned to lock the door (fig. 3).

2.) From the exterior of the home, once the deadbolts are engaged the door key may be used to lock the door (fig. 4).

**Disengaging the Deadbolts**

To disengage the deadbolts and open the door:

1.) The door must be unlocked using the thumb latch or a key (fig. 5).

2.) Once the door is unlocked the handleset must be rotated downward. This will retract all three deadbolts and the latch (fig. 6).
