To test your door for warp, take a 14' string and wrap it over the top and bottom edges of the door. Pull the string tight and look at the string in the location of the lockset (fig.1).

If the door is warped there will be a gap between the edge of the door and the string. Small variances may exist, but a truly warped door will show about ¼" distance between the surface of the door and the string. Repeat for both sides of the door. (fig.2).

If the door does not have a gap between the string and the surface of the door. The lock and hinge side jambs may not be parallel and will need to be adjusted. Please see the checking for plumb reference guide.
