INTERIOR DOOR PLUMB TEST

This guide is to help determine if your door is plumb. Doors that are out of plumb typically appear to be pulling away from the jamb and into the room.

REQUIRED TOOLS: 4’-6’ Level

1) To check the door for plumb, first place the level on edge, on the hinge side jamb.

2) Make sure the bubble is centered between the lines. If it is not, then move the level until the bubble is perfectly centered in order to determine the distance the jamb will need to move to correct the installation of the door frame.

3) Next place the level on edge, on the strike side jamb.

4) Make sure the bubble is centered between the lines. If it is not, then move the level until the bubble is perfectly centered in order to determine the distance the jamb will need to move to correct the installation of the door frame.

If both the hinge and strike jambs are plumb, please refer to the Interior Door Warp Test. If the jambs were not plumb, correct the installation.
