1) Remove Door
Remove the door slab from the door opening and lay it down with the exterior of the door facing up. Make sure there are no foreign materials in contact with the interior surface of the door. This could lead to surface damage on the product.

2) Position Kickplate
Place the kickplate on the door surface. Center the kickplate from left to right, 1” from the bottom edge of the door.

3) Punch Holes
Using a punch, make a hole in the center of the first kickplate screw location.
Note: Make sure the hole is not too large or it will not allow the screw to grab the door edge.

4) Insert Screws
Insert the first screw and tighten.
Repeat steps 3 and 4 for the remaining screw holes.

5) Replace Door into Frame
Place the door slab back into the door opening.
