On rare occasion, the placement of the lite in your Mastercraft door may shift position slightly. This condition can usually be corrected very easily.

**REQUIRED TOOLS:**
Screw Gun

1) Loosen the screws on the interior side of the lite. They do not need to be removed completely at this point.

2) With the screws loosened, pull down on the side that is highest in the cutout opening, until the position is corrected.

3) Once the lite is square in the opening, tighten the screws.
