LOOSE HINGE SCREW CORRECTION

REQUIRED TOOLS:
Flathead Screwdriver,
Dowel Rods, Hammer, Punch

1) Using a #2 screwdriver, attempt to tighten the screws. If a screw will not tighten, the screw hole will need to be filled.

2) Remove the pin from the hinge. Then remove screws and take the hinge out of the pocket.

3) Insert dowel rods or tooth picks into the effected screw hole. Use the hammer to tap the filler material into the hole as tight as possible.

5) Break off any excess material flush with the frame.

5) Reattach the hinge and screws using the flathead screwdriver. Be careful to not overtighten the screws.

6) Replace the hinge pin by gently tapping with the hammer.
