STEEL & SMOOTH FIBERGLASS DOOR FINISHING

REQUIRED TOOLS:
Sandpaper, Latex Paint, Paint Roller, Masking Tape, Cleaning Rags, Mild Detergent

1) Remove the door from the frame of the door unit by removing all of the hinge pins.

2) Place the door unit onto two padded saw horses.

3) Remove all dust and debris from the surface of the door and lightly sand the entire door surface using a fine grit sandpaper.
   NOTE: Failure to sand the door will create adhesion problems between the doors surface and the latex paint.

4) Wash the door with a mild detergent and rinse the surface. Allow to dry completely before starting the paint process.

5) If your door unit has glass, use masking tape to mask off all areas of the door or frame that you do not want painted.
   Lite Frame Painting: Prime the lite frame using Rust-Oleum® Specialty Plastic Primer Spray before painting with latex paint.

6) Using a roller, apply a finishing coat of high quality latex paint. Allow the door to dry completely before re-installing into the door frame.
