1) Check Glaze - Align Snaps

The replacement snap lite frames will come pre-glazed. If the frame is not pre-glazed contact the store at which it was purchased.

When the lite arrives the inner and exterior frames will be spun 180 degrees so that the snaps do not line up. Before installation the inner frame must be rotated to make contact with the exterior frame.

2) Ask a Friend

With the assistance of a friend. Have the friend hold onto the exterior side of the glass and place it into the door opening.

Place the interior frame into the opening so that the snaps are aligned.

3) Snap Frames Together

Use a rubber mallet to snap the two halves of the frame together by first holding a cloth over the frame in the location where the mallet is going to be used and then striking the frame in the location of the cloth. For best results have your friend apply pressure to the lite frame in the area that you are trying to snap.

Repeat this process for the entire lite frame until all locations are snapped.

4) Double Check

Double check the lite frame to make sure that all snap locations are sealed. If the frame did not snap closed there will be a gap between the lite and the frame.
