Remove the door from the jamb before replacing the bottom door sweep. For in-swing doors, with the door closed, remove the hinge pins with a punch. **Note:** For out-swing doors you will need to remove the screws from the hinges. Carefully remove the door with the help of an assistant.

Using a flat screwdriver, pry the existing door sweep from the bottom of the door.

Place the door slab horizontally on two padded saw horses. Make sure the door surface will be protected from scratches.

Before applying the new sweep to the door, place a bead of high quality exterior grade silicone on each end of the sweep.

Apply the new door sweep by first making sure it is flush with the end of the door. Next, place the barbs into the bottom door kerf and use the rubber mallet to pound the sweep tightly into the kerf.
