Every MASTERCRAFT® door system requires corner seals at the bottom of the door between the sill and the frame to ensure proper sealing. If these are removed during painting or damaged through normal door use, light or air infiltration may occur. Please follow these instructions to replace the seals.

1) Make sure the weather stripping surrounding the door frame is in good condition. There should be no tears or holes. Replacement weather stripping for Mastercraft steel entry doors is available at Menards.

2) Scrape off existing caulk from the back of the sill to heel to the front. Remove damaged corner seals and make sure the door frame at the bottom on both sides of the door are clean and dry.

3) Remove the paper to expose the adhesive back of the corner seal.

4) On the hinge side of the frame, place the bottom of the corner seal flush with the top of the sill and under the edge of the weather stripping, with the narrow edge of the corner seal facing inside your home. Press firmly. A bead of caulk should be put front to back back of sill.
